

**AMENDMENTS TO THE SPECIFICATION WITH MARKINGS TO SHOW
CHANGES MADE**

Amend Paragraph [0009] as follows:

[0009] --Typically, a measurement or control action is "triggered" by a clock, i.e., initiated at a certain instant. If different actions are triggered by independent clocks, then these actions are synchronous only to a limited extent due to the time differences caused by the inaccuracy of the clocks. The synchronism can be improved by aligning their clocks, for example, by Global Positioning Satellite (GPS) signals or radio timing signals. --.
